

## OLT Offshore LNG Toscana

### Allocation of the slot of 07/03/18

Livorno, 27<sup>th</sup> February 2018 - OLT Offshore LNG Toscana informs that yesterday, as a result of the allocation procedure published on OLT website, the slot of March 7<sup>th</sup>, 2018 was allocated.

Following the allocation of the slot and given the coincidence in time with the Peak Shaving service, in accordance with the Peak Shaving procedure and the Regasification Code, the user will receive the gas, currently stored onboard the Terminal; the so anticipated gas will be restored with the arrival of the LNG carrier.

This is a measure that follows the activation by the Ministry of Economic Development of the state of early warning, the first of the three levels provided by the national gas emergency plan, given both the weather forecasts (particularly harsh temperatures are expected for next week in Italy and Europe) and the reduced transport capacity on the TENP pipeline in Germany, which is undergoing maintenance, thus limiting imports from Northern Europe; and the withdrawal from storage system slightly but repeatedly higher than the daily withdrawal capacity allocated and available to the Users.

**OLT Offshore LNG Toscana S.p.A.**, set up from the association of Iren Group (49.07%), Uniper Global Commodities SE - formerly E.ON Global Commodities SE- (48.24%) and Golar LNG (2.69%), owns and manages the floating regasification Terminal "FSRU Toscana". The Terminal, moored about 22 km off the coasts between Livorno and Pisa, is connected to the national grid through a 36.5 km long pipeline, operated and managed by Snam Rete Gas, of which: about 29.5 km at sea, 5 km in the floodway and the remaining 2 km on dry land. At full capacity, the Terminal has a regasification capacity of 3.75 billion cubic meters a year, about 4% of the national gas consumption.
