

The OLT Terminal obtains EMAS registration After ISO 14001, a further acknowledgment in terms of environmental sustainability

Livorno, June 26th 2018 - OLT Offshore LNG Toscana announces that it has obtained the EMAS registration from the Ecolabel-Ecoaudit Committee, in relation to its "FSRU Toscana" regasification Terminal; the registration certificate will be valid until 2021.

For OLT - already certified ISO 14001 since 2012 - this is a further and important acknowledgment that attests the utmost attention paid by the company to the environmental sustainability aspects.

In general terms - said the managing directors of OLT, Alessandro Fino and Richard Fleischmann - the EMAS certification is part of the wider vision that the company has in managing its business responsibly. In fact, the continuity of the environmental performance achieved in recent years with the application of the Management System and the achievement of the planned improvement objectives testify the commitment that the organization pays in carrying out its work.

"It was a very demanding process - underlined Monica Giannetti, HSEQ manager of OLT - which involved us for about a year of work; a path that is not interrupted here because, year after year, we will have to continue to operate ensuring the highest environmental performance, as well as, of course, security, and ensuring a transparent dialogue with the population and all stakeholders as currently witnessed by the "Environmental Statement 2017" (related to the years 2014-2017).

***OLT Offshore LNG Toscana**, set up from the association of Iren Group (49.07%), Uniper Global Commodities - formerly E.ON Global Commodities - (48.24%) and Golar LNG (2.69%), owns and manages the floating regasification Terminal "FSRU Toscana". The Terminal, moored about 22 km off the coasts between Livorno and Pisa, is connected to the national grid through a 36.5 km long pipeline, operated and managed by Snam Rete Gas, of which: about 29.5 km at sea, 5 km in the floodway and the remaining 2 km on dry land. At full capacity, the Terminal has a regasification capacity of 3.75 billion cubic meters a year, about 4% of the national gas consumption.*
